Online Appendix

Policies or Prejudices? An Analysis of Antisemitic and Anti-Israel Views on Social Media and Social Surveys

Journal of the European Economics Association

Noam Binstok, Eric D. Gould, and Todd Kaplan

This section describes the extraction and variable construction of the Twitter data. The data includes 453,930 tweets about Israel, Jews, and Tottenham published in the United Kingdom from 2013 to 2022.

The data was obtained using Twitter academic API. Only tweets that were identified as being published from the UK and containing geocoded information were extracted, since the empirical strategy is to use variation at the district and daily level within the UK.[1] Therefore, the extracted tweets represent the universe of tweets that are both geocoded to be from the UK and contain the relevant keywords: Israel and Israeli, Tottenham, Jew and Jewish. The sample does not represent the universe of tweets emanating from the UK, since many tweets are not geocoded. Nevertheless, there is little reason to think that the sample construction creates a bias in the analysis of how tweets are related between Israel, Jews, and Tottenham at the daily and district level.

The extracted twitter data includes 140,217 tweets mentioning Israel, 108,945 tweets mentioning Jews, and 204,768 tweets using the word "Tottenham".[2] For the placebo analysis, the data also contains 277,784 tweets mentioning "China." For each tweet, the data contains the text of the message, the user who published the tweet, and geographic data. Tweet locations within large cities usually are composed of the neighborhood, while tweets from smaller cities or towns include the entire town. Dates with unusual military operations or civil unrest between Israel and Palestinian factions were dropped from the sample.[3]

---

[1] The locations of tweets are not given as single points, but as polygons. The polygons within large cities such as London usually cover a neighborhood while the polygons in smaller cities or towns cover the entire area. We have aggregated the locations to 355 districts in the United Kingdom using the "Ordnance survey data Boundary-Line" which maps the boundaries of each district in the UK. See https://osdatahub.os.uk/ for additional information.

[2] The results from each Twitter query are limited to 500 results, for this reason, we queried the API twice a day (once for every 12 hours range), obtaining a maximum of 1,000 results per day. Tweets about Israel contain one of the following keywords: Israel, Israelis, and Israelies. Tweets about Jews contain the keywords Jew, Jewish, and Jews. Tweets about Tottenham are limited to Tweets containing the word Tottenham directly.

[3] Dates that were excluded due to military operations and civil unrest include: 2014 Gaza War (Operation Protective Edge) from June 11, 2014 to August 27, 2014; 2019 Gaza Escalation (Operation Closed Garden) from

For each tweet, sentiment analysis was conducted using a Natural Language Processing (NLP) model. The model produces three sentiment scores for every tweet: negative, neutral, and positive. The sum of all three is 1 (100 percent). The analysis was performed with the "TweetNLP" classifier (Camacho-Collados et al. (2022)), which was developed by a group of researchers in several universities in the UK in 2022 and aims at supplying NLP-based tools for the analysis of tweets. The "TweetNLP" model was chosen for two key reasons. First, the model was trained and implemented on Tweets directly, rather than being a "general purpose model" for sentiment analysis of any kind of text. Second, this model uses a robust and well-tested architecture for the purpose at hand. The "TweetNLP" model is based on the "Robustly Optimized BERT-Pretraining Approach" (RoBERTa) architecture which is built on BERT (Devlin et al, 2019). As of March 2023, the model has a website where users can input text and receive the prediction made by the model at the address: https://tweetnlp.org/.

Examples of the sentiment analysis from actual tweets include:

	Sentiment		
Text of the Tweet	Negative	Neutral	Positive
I feel I've been lied to all my life over Israel, only recently seeing the light, now supporting Palestinians	0.81	0.17	0.02
Feel proud that #telaviv has been nominated for 'city of the year' #aww #mysecondhome #israel #beautiful	0.00	0.01	0.99
Interesting report on BBC Radio 4 about Israel's international image and whether it cares about it, or even if it should.	0.02	0.67	0.31

The twitter data is aggregated to the day and district level, yielding 1,290,780 observations in 355 districts. Each observation contains variables for the cumulative number of tweets that contain terms related to Jews, Israel, or Tottenham on that day in a given district. In addition, each observation contains variables for the cumulative scores of tweets on each topic (Jews, Israel, or Tottenham) that are positive, negative, and neutral. Table 1 shows that the average sentiment of tweets about Israel and Jews is negative, while the average sentiment of tweets about Tottenham is positive.

The twitter data was matched to a map of districts in the UK, stadium locations, and dates of games played by Tottenham. The sample includes 370 English Premier League games played by Tottenham during this period. Information about games was assembled with the worldfootballR package in R which aggregates football data from multiple sources and was obtained using Kaggle.[4] The data for each game contains the date, score, and home and away teams. For each tweet, we calculated the distance to the stadiums of the home team and the

May 2, 2019 to May 7, 2019; 2019 Israel-Islamic Jihad conflict (Operation Blackbelt) from November 11, 2019 to November 15, 2019; 2021 Israeli-Palestinian conflict (Operation Guardian of the Walls) from May 9, 2021 to May 22, 2021; unrest following the decision to move the American embassy to Jerusalem from December 5, 2017 to December 9, 2017; and the ceremony of opening the American embassy in Jerusalem from May 13, 2018 to May 15, 2018.

[4] See https://www.kaggle.com/datasets/evangower/premier-league-matches-19922022.

away team. The locations of the stadiums were obtained using the sports statistics blog: https://rpubs.com/Rogue_Derivative/835786 as well as https://opisthokonta.net/ and Google maps. Districts within a 25 km distance to the opposing team's stadium were considered a district for the opposing team. The distance was determined by the average of the distance from the opposing team's stadium to the two edges of the polygon given by Twitter. We set the threshold for a close game at 25 km from the stadium, but the results in Appendix Table 3 show similar results using 15 km and 20 km thresholds.

Observations	1,246,760							

Robust standard errors, clustered by district, are in parentheses. *** p<0.01, ** p<0.05, * p<0.1 . Each column represents a separate regression. Each observation in the sample represents the total number of tweets by day (3,531 days) and location (355 districts). The sample is described in the notes to Table 1. "Tottenham Game Window" is a dummy variable equal to one for the four days before Tottenham plays, the day of Tottenham's game, and the four days after Tottenham's game. "Opposing Location" is a dummy variable equal to one if the the district is within 25 kilometers of the opposing team's stadium that is playing Tottenham (regardless of whether Tottenham is playing at home or away). Every specification controls for fixed-effects for 355 locations, year, month of the year, and day of the week.

Robust standard errors in parentheses. *** p<0.01, ** p<0.05, * p<0.1. Each row panel and column represents a separate IV regression. The instrument for the endogenous variable (Jews - Too Much Influence) is an indicator for the interviewer being 75 or older at the time of the interview. The first stage f-statistic is around 5 across specifications. The sample is taken from the German General Social Survey (ALLBUS) from 2016 and is described in the notes to Table 6.

The sample is taken from the data released by Kaplan and Small (2006) which is derived from a survey in 2004 by the Anti-Defamation League (ADL) in ten European countries. The survey contains respondents between the ages of 18 and 64 as of 2004. For reasons explained in the text, the sample is restriced to Christian and religiously non-affiliated respondents.
